Dear Colleague:

This Directory was compiled to provide the CCELC Wildlife Working Group membership with a list of people presently interested in, or working on, projects designed to address land/wildlife integration, ecological survey and/or inventory and monitoring , and other related issues.

We plan to update the Directory whenever possible. Please forward any corrections or new information to:

THE CANADA COMMITTEE ON ECOLOGICAL LAND

CLASSIFICATION - THE WILDLIFE WORKING GROUP

Ecology is a science which concentrates on the relationships of living organisms with one another and to their environment. Environment is a term used to describe the worldly features (e.g., land, water, and air) which combine in many ways to make life possible. Ecological Land Classification (ELC) is a process developed to assist man in his efforts to define the environment and organize it into manageable and understandable chunks. In this context, the environment is composed of natural and man-modified ecosystems, each being comprised of a complex array of ecological components including: landforms, bedrock geology, soils, climate, air, water, vegetation, and wildlife.

Resource managers strive to learn about the environment through the completion of Ecological Land Surveys (ELS). An ELS is an interdisciplinary approach to gathering and interpreting environmental data. The ELC component includes the description and synthesis of data related to the physical and biological characteristics of the environment.

The Canada Committee on Ecological Land Classification (CCELC) was formed in 1976 to "encourage the development and application of a uniform ecological approach to land classification". The objectives of the Committee are:

1. To encourage the development of a uniform approach to ecological land classification.

2. To promote the application of a uniform approach to ecological land classification.

These objectives are being pursued through:

1. The exchange of technical information and the organization of problem-oriented working groups and workshops.

2. The encouragement of the development and wide distribution of information on methodology and procedures of ecological land classification.

3. The promotion of discussions with the general public, users, and potential users on the presentation and application of ecological data bases.

4. The development of recommendations and advice to governmental and private agencies on the application, feasibility, methodology, benefits, and cost of ecological land surveys.

The CCELC is presently comprised of four working groups: the Vegetation Working Group, the Ecoregion Working Group, the Wetland Working Group, and the Wildlife Working Group. Each working group is charged with a specific set of tasks relating to the advancement of Ecological Land Surveys.

The CCELC retains a permanent secretariat, which is staffed and funded by Lands Directorate of Environment Canada, Ottawa.

The Wildlife Working Group

Wildlife resources are important to people throughout the world. They provide recreational opportunities, food, and clothing. Wildlife represent an important part of our cultural heritage, and play an integral role in the maintenance and enhancement of environmental quality. Therefore, the conservation or "wise-use" of wildlife and wildlife habitat is a strategic aspect of resource management planning. Effective resource management is founded, in part, on the principle that the better we understand our environment, the better we can manage our resources.

The management of wildlife resources within an ecological framework, fostered through the development of the ecological land classification system, is an important but extremely difficult issue to address. The Wildlife Working Group was formed in 1980 to address this difficult problem. The goal of the Working Group is "to encourage and facilitate the development of effective and standardized methodologies for wildlife habitat classification and evaluation, as well as to further the integration of wildlife values within an ecological land survey framework."

The objectives of the Working Group are best reflected by listing some of the major objectives of the three workshops:

1. To assemble those concerned with the integration of wildlife information into ecological land surveys to exchange ideas and experiences.

2. To generate ideas and recommendations, based on experience to-date, on how to effectively incorporate wildlife data and information into land data bases.

3. To define and document, with the aid of historical perspectives, what wildlife habitat inventories are, why we do them (what their uses are), and what their deficiencies have been in the past.

4. To identify the advantages and disadvantages of pursuing an integrated (ecological) approach to habitat inventory, including identification of appropriate and inappropriate integration methodologies and product formats.

5. To provide a technical review of national standards for "Guidelines for the Integration of Wildlife Resource Assessment with Ecological Land Survey".

6. To update the status of wildlife/ecological land survey research in Canada.

The objectives of the Working Group will remain necessarily flexible to accommodate new projects and priorities as they are identified and implemented.
